

This is a simple word document that was created in Office 2010/Word 2010.

This document has a hyperlink that works in word, and it goes to the travelers website:

Go to the [Travelers](http://Travelers) web site by clicking the blue word Travelers.

Go to [www.travelers.com](http://www.travelers.com) and word automatically turned this address to a hyperlink.

Now I just shut off the feature shown in the screen shot below and when I type [www.travelers.com](http://www.travelers.com) it does not automatically get hyperlinked in Word, and it might get hyperlinked in Adobe Reader version 9.0 and above. This .pdf file was stored on my website for testing. [www.danielguinan.com/MyPDFtest.pdf](http://www.danielguinan.com/MyPDFtest.pdf)
